A simulated pattern of the **GT190 Fraze-Groomer's** result

Result:

Left side: untreated

Right side: treated with the **GT190 Fraze-Groomer**

The **GT190 Fraze-Groomer** is a very useful tool for removing unwanted POA-ANNUA from greens. The blade tips of the counter rotating blades will lift out the POA ANNUA plants.

Why use the **MAREDO GT190 Fraze-Groomer**?

Greens groomers or light verticutters are great tools to control the horizontal grass growth and thatch build up. The problem with groomers and light verticutters is that they leave visible slits which can affect ball roll on greens. **MAREDO** found the solution for this problem and uses a unique system of mounting the blades at an angle on the main shaft. With this system each blade tip creates a short, hardly noticeable slit.

Another unique feature of the **GT190** is that the main shaft counter rotates. This results in cleaner cutted slits and better removal of material. Incorporated brushes help cleaning the surface and will brush the loose material into the heavy duty **MAREDO** collecting boxes.

The working depth of the **GT190** is easy to change by turning the quick adjusters. Maximum working depth is 6 mm. (0.25")
